PROGRAMMING LANGUAGES PRINCIPLES AND PARADIGMS

CSIE Dept., NDHU, Fall 2024

Programming Notes #1

PROGRAMMING NOTES #1

- Suggested Steps
- Programming Environment
- Basics of Flex and Bison
- A Practical Example

SUGGESTED STEPS

WHAT TO DO (T)

- Write a lex specification `t_lex.l`.
- Write a yacc specification `t_parse.y`.
- Write a main function `t2c.c`.
- Write a header file `t2c.h`.

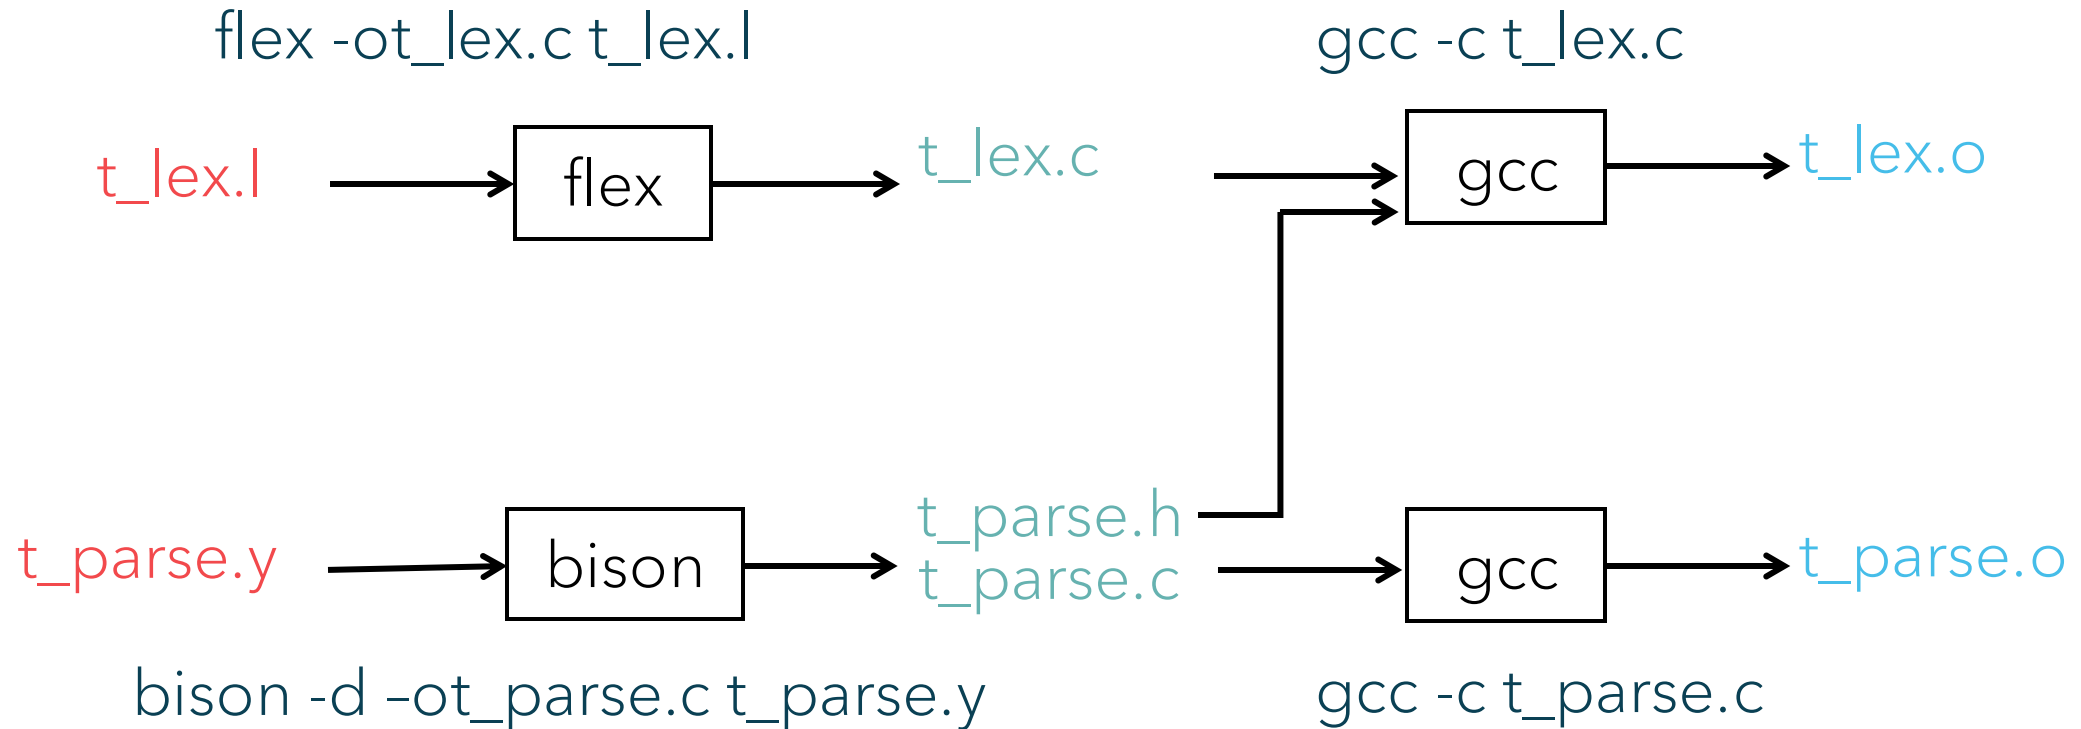

SUGGESTED STEPS

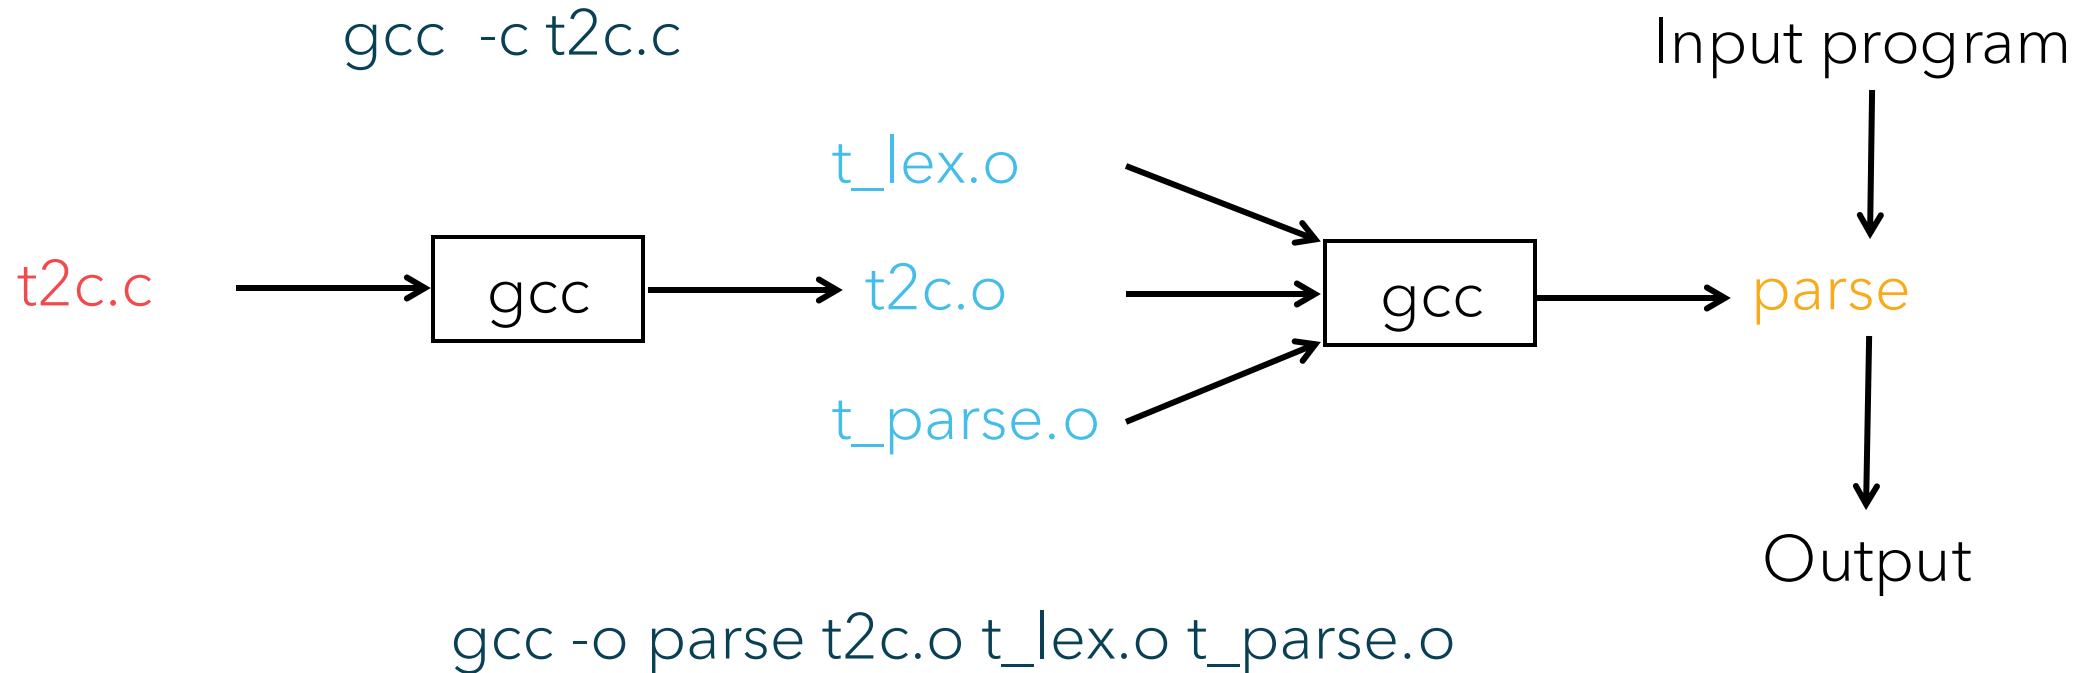

- 1) Use bison to compile `t_parse.y` into `t_parse.c`.
The `-d` switch produces a header file `t_parse.h`.
- 2) Use flex to compile `t_lex.l` into `t_lex.c`.
- 3) Use gcc to compile `t_lex.c` into `t_lex.o`,
`t_parse.c` into `t_parse.o`, and `t2c.c` into `t2c.o`.
- 4) Use gcc to link `t2c.o`, `t_lex.o`, and `t_parse.o` into
`parse`.

GENERATING C CODE

BUILDING EXECUTABLE

PROGRAMMING ENVIRONMENT

SOFTWARE

- 1) Flex 2.5.4
- 2) Bison 2.4.1
- 3) MinGW 4.6.2

Notes

- DO NOT install both MinGW and DevC.
- Check and set up environment variables.
- Rebooting after installation is suggested.

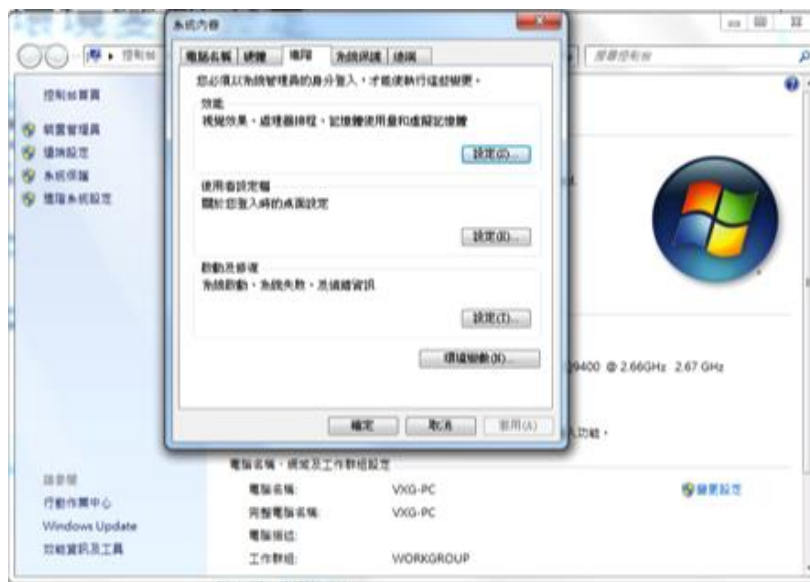

ENVIRONMENT VARIABLES

- Check whether `C:\MinGW\bin` is in `PATH`. If not, add it into `PATH`, using `;` as separators.
- In case of using `DevC`, check for `C:\Dev-Cpp\bin` instead.

ON WINDOWS

TEST INSTALLATION

```
C:\C:\WINDOWS\system32\cmd.exe
Microsoft Windows XP [版本 5.1.2600]
(C) Copyright 1985-2001 Microsoft Corp.

C:\Documents and Settings\fdas>gcc --version
gcc (GCC) 4.6.2
Copyright (C) 2011 Free Software Foundation, Inc.

C:\Documents and Settings\fdas>flex -U
flex version 2.5.4

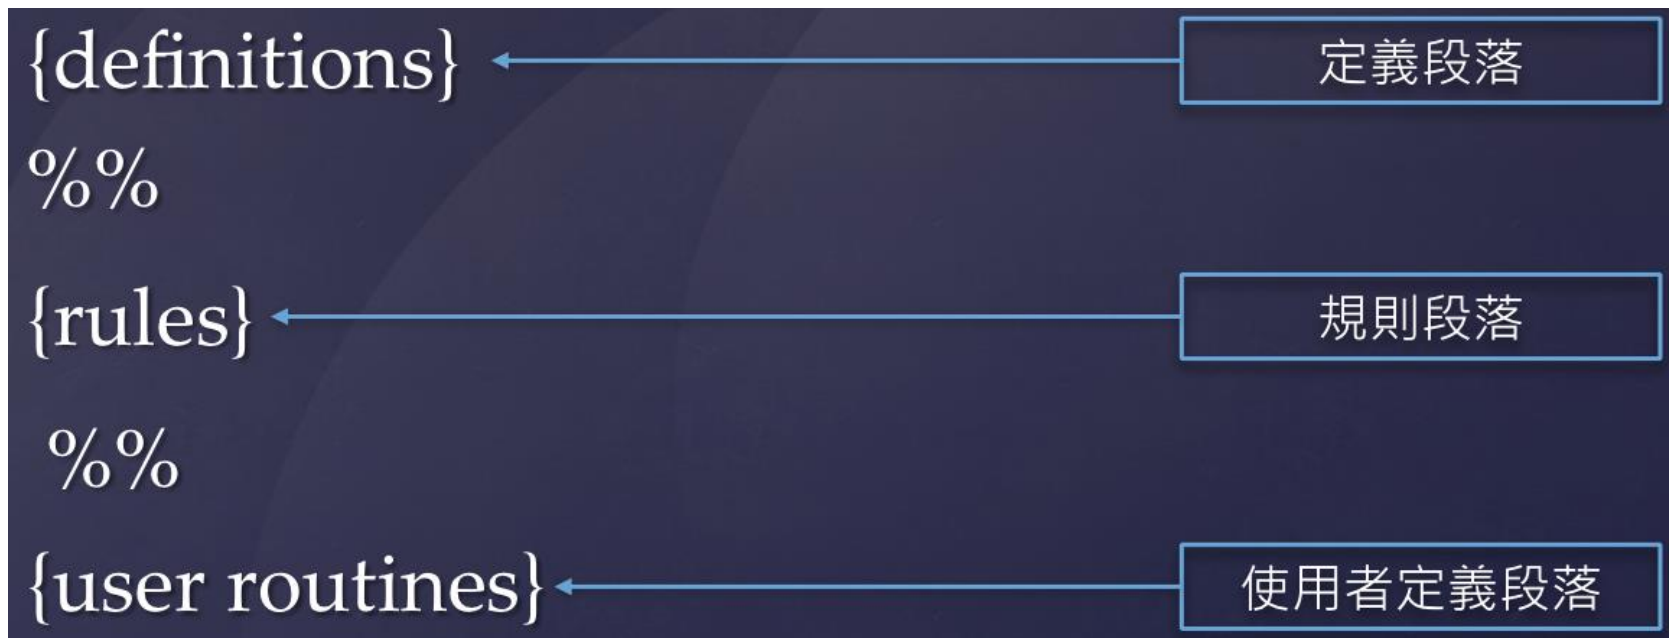

C:\Documents and Settings\fdas>_
```

FLEX AND BISON

Basics

FLEX SPECIFICATION

FLEX SPECIAL CHARACTERS

Char	Meaning
.	Any character except for '\n'
-	The range of characters, e.g., a-z
*	Repeat for 0 or more times
+	Repeat for 1 or more times
?	Appear either 0 or 1 time
^	Negation
A B	A or B
"sth."	Exactly the characters appeared in parentheses (sth.)

FLEX COMPILATION

- `flex -ot_lex.c t_lex.l`
- Translate `t_lex.l` into `t_lex.c`.
(Specify the filename of your own.)
- (With `old` versions)
There is **NO space** between `-o` and `t_lex.c`.

FOR THIS ASSIGNMENT

- Write your own `t_lex.l` according to the description of T lexicons, and compile into `t_lex.c`.
- `flex -ot_lex.c t_lex.l`

A BISON SPECIFICATION

DEFINITION (P EXAMPLE)

```
1  %{
2      #include <stdio.h>
3      #include <stdlib.h>
4      #include <string.h>
5      #include "pascal.h"
6  %}
7  %token PROG PROC BG END INT BOOL TRUE
8  %token LP RP LSP RSP FALSE CC
9  %token DOT SEMI VAR ARRAY OF DOTDOT
10 %token IF THEN READ WRITE WHILE DO
11 %token ELSE ASSIGN COMMA COLON ID NUM
12 %left OR AND
13 %left NOT
14 %left EQ NE LT GT LE GE
15 %left ADD MINUS
16 %left DIV TIMES
17 %expect 1
18
19 %%
```

定義段落

RULES (P EXAMPLE)

```
19  %%
20  prog  :  PROG ID SEMI block DOT {printf("prog => PROG ID SEMI block DOT \n*****
21         |  {printf("*****Parsing failed! \n");}
22         ;
23
24  block  :  vardecs prodecs stmts {printf("block=>vardecs prodecs stmts \n");}
25         ;
26
27  vardecs :  VAR vardec SEMI morevd {printf("vardecs => VAR vardec SEMI morevd \n");}
28         |  {printf("vardecs => Null \n");}
29         ;
30
31  morevd :  vardec SEMI morevd {printf("morevd => vardec SEMI morevd \n");}
32         |  {printf("morevd => Null \n");}
33         ;
34
35  vardec  :  ID moreid COLON type {printf("vardec => ID moreid COLON type\n");}
36         ;
37
38  moreid  :  COMMA ID moreid {printf("moreid => COMMA ID moreid \n");}
39         |  {printf("moreid => Null \n");}
40         ;
41
```

規則段落

FOR THIS ASSIGNMENT

- Write your own `t_parse.y` according to the description of T grammars, and compile into `t_parse.c`.
- `bison -d -o t_parse.c t_parse.y`
- To run your parser:
`./parse test.t`

COMMANDS USED

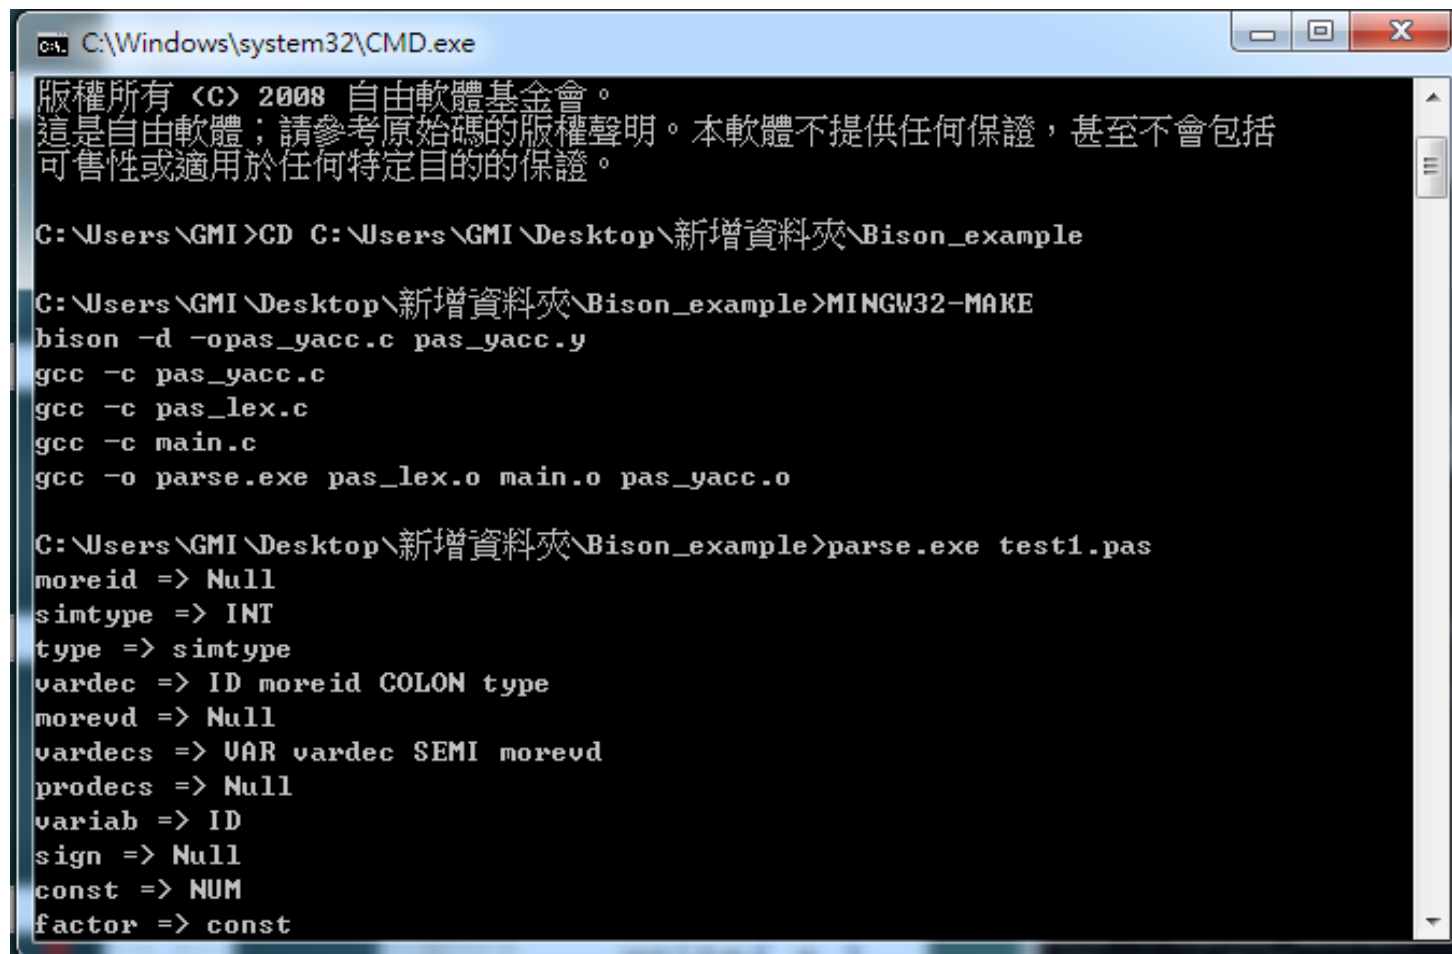

- **Bison**
`bison -d -o t_parse.c t_parse.y`
- **Flex**
`flex -ot_lex.c t_lex.l`
- **GCC**
`gcc -c t_lex.c`
`gcc -c t_parse.c`
`gcc -c t2c.c`
`gcc -o parse t_lex.o t2c.o t_parse.o`

A PRACTICAL EXAMPLE

BUILD EXECUTABLE (P)

```
C:\Windows\system32\CMD.exe

- <http://www.gnu.org/software/bison/>
- <http://sourceforge.net/projects/gnuwin32>

WHAT TO DO?

Use *lex* (or *flex*) and *yacc* (or *bison*) to implement a front end (including a lexical analyzer and a syntax recognizer) of the compiler for the *T* language, showing the grammar rules applied while parsing.

- See an attached file for the lexical rules in details.
- You are requested to separate the *C* code, the *Lex* specification, the *Yacc* specification into distinct files.

WHAT EXACTLY TO DO

By design, the program is splitted into 4 files:

- `t_lex.l`
- `t_parse.y`
- `t2c.c`
- `t2c.h`

```

Understand the rules
and write them here!

The T Lexicons

Keywords (All keywords are reserved. Each keyword can be a terminal.):

WRITE READ IF ELSE RETURN BEGIN END MAIN INT REAL

Single-character separators (Each operator can be a terminal.):

; , ()

Single-character operators (Each operator can be a terminal.):

+ - * / > <

Multi-character operators (Each operator can be a terminal.):

:= == != >= <=

Identifiers:

An *identifier* consists of a letter followed by any number of letters or digits.

Integer numbers:

An *integer number* is a sequence of digits, where a *digit* has the following definition:

Digit -> '0' | '1' | '2' | '3' | '4' | '5' | '6' | '7' | '8' | '9'

Real numbers:

A *real number* is a sequence of digits followed by a dot, and followed by digits.

Comments:

A *comment* is a string between /* and */. Comments can be longer than one line.

QStrings:

A *QString* is any sequence of characters except double quote itself, enclosed in double quotes.

T_PARSE.Y (1/3)

```
%{  
    #include <stdio.h>  
    #include <stdlib.h>  
    #include "t2c.h"  
    #include "t_parse.h"  
}%
```

```
%token \WRITE \READ \IF \ASSIGN  
%token \RETURN \BEGIN \END  
%left \EQU \NEQ \GT \LT \GE \LE  
%left \ADD \MINUS  
%left \TIMES \DIVIDE  
%token \LP \RP  
%token \INT \REAL \STRING  
%token \ELSE  
%token \MAIN  
%token \SEMI \COMMA  
%token \ID \INUM \RNUM \QSTR
```

```
%expect 1
```

```
%%
```

Declare your tokens
and delete others

No need to change!

T_PARSE.Y (2/3)

```
prog : mthdcls
      { printf("Program -> MethodDecls\n");
        printf("Parsed OK!\n"); }
      |
      { printf("***** Parsing failed!\n"); }
      ;
```

```
mthdcls : mthdcl mthdcls
          { printf("MethodDecls -> MethodDecl MethodDecls\n"); }
          |
          mthdcl
          { printf("MethodDecls -> MethodDecl\n"); }
          ;
```

```
type : lINT
        { printf("Type -> INT\n"); }
        |
        lREAL
